# 1 Building Abstractions with Procedures

**Definition (computational process)**

Abstract beings that inhabit computers.

**Definition (data)**

Computational processes manipulate other abstract things called ***data*** as they evolve.

**Definition (program)**

A pattern of rules by which the evolution of a computational process is directed.

**Definition (programming language)**

That in which programs are carefully composed from symbolic expressions that prescribe the tasks we want our computational processes to perform.

**Definition (bug, glitch)**

Small errors.

**Definition (debug)**

Remove bugs.

## Programming in Lisp

See the [appendix](#).

## A Notes on LISP

### A.1 McCarthy 1960

*Recursive Functions of Symbolic Expressions and Their Computation by Machine*

#### A.1.1 Introduction

LISP:

- "LISP Processor"
- Developed for the IBM 704 computer by the Artificial Intelligence group at M.I.T.
- Designed to facilitate experiments with a proposed system called the *Advice Tracker*:
  - A programming system for manipulating expressions representing formalized declarative and imperative sentences so that the Advice Tracker system could make deductions.
  - Originally proposed in November 1958.
- Came to be based on a scheme for representing the partial recursive functions of a certain class of symbolic expressions, independent of any electronic computer.

In this article:

1. Describe a formalism for defining functions recursively.
2. Describe S-expressions and S-functions, give examples, and describe the universal S-function *apply* which plays the theoretical role of a universal Turing machine and the practical role of an interpreter.
3. Describe the representation of S-expressions in the memory of the IBM 704 by list structures ... and the representation of S-functions by program.
4. Mention the main features of the LISP programming system for the IBM 704.
5. Another way of describing computations with symbolic expressions.
6. Give a recursive function interpretation of flow charts.

#### A.1.2 Functions and Function Definitions

##### Definition (partial function)

A function that is defined only on part of its domain.

##### Definition (propositional expression)

A *propositional expression* is an expression whose possible values are *T* (for truth) and *F* (for falsity)

**Definition (predicate)**

A function whose range consists of the truth values  $T$  and  $F$ .

**Definition (conditional expression)**

A device for expressing the dependence of quantities on propositional quantities, denoted:

$$(p_1 \rightarrow e_1, \dots, p_n \rightarrow e_n)$$

where the  $p$ 's are propositional expressions and the  $e$ 's are expression of any kind, read “If  $p_1$  then  $e_1$ , otherwise if  $p_2$  then  $e_2$ , ... otherwise if  $p_n$  then  $e_n$ ” or “ $p_1$  yields  $e_1$ , ...,  $p_n$  yields  $e_n$ .”

**How to determine the value of an arbitrary conditional statement** ( $p_1 \rightarrow e_1, \dots, p_n \rightarrow e_n$ ):

- Let  $i = 1$ .
- If the value of  $p_i$  is undefined, then the value of the conditional expression is undefined.
- If the value of  $p_i$  is  $T$ , then the value of the conditional expression is the value of the expression  $e_i$ .
- If the value of  $p_i$  is  $F$ , then increment  $i$  and evaluate  $p_i$ .

*Example.*

- $(1 < 2 \rightarrow 4, 1 > 2 \rightarrow 3) = 4$

Starting from the left with the statement  $1 < 2 \rightarrow 4$ , the propositional expression  $1 < 2$  is true, therefore the value of the conditional expression is 4.

- $(2 < 1 \rightarrow 4, 2 > 1 \rightarrow 3, 2 > 1 \rightarrow 2) = 3$

Starting from the left with the statement  $2 < 1 \rightarrow 4$ , the propositional expression  $2 < 1$  is false. Moving on to the next statement  $2 > 1 \rightarrow 3$ , the propositional expression  $2 > 1$  is true, therefore the value of the conditional expression is 3.

- $(2 < 1 \rightarrow 4, T \rightarrow 3) = 3$

The propositional expression  $2 < 1$  is false, so move on. The propositional expression  $T$  is true, therefore the value of the conditional expression is 3.

- $(2 < 1 \rightarrow \frac{0}{0}, T \rightarrow 3) = 3$

The propositional expression  $2 < 1$  is false, so move on. The propositional expression  $T$  is true, therefore the value of the conditional expression is 3.

- $(2 < 1 \rightarrow 3, T \rightarrow \frac{0}{0})$  is undefined.

The propositional expression  $2 < 1$  is false, so move on. The propositional expression  $T$  is true, therefore the value of the conditional expression is the value of the expression  $\frac{0}{0}$  which is undefined.

- $(2 < 1 \rightarrow 3, 4 < 1 \rightarrow 4)$  is undefined.

The propositional expression  $2 < 1$  is false, so move on. The propositional expression  $4 < 1$  is false, so move on. There's nothing else to move on to, so the value of the conditional expression defaults to being undefined.

*Example.* Applications:

- $|x| = (x < 0 \rightarrow -x, T \rightarrow x)$
- $\delta_{ij} = (i = j \rightarrow 1, T \rightarrow 0)$
- $sgn(x) = (x < 0 \rightarrow -1, x = 0 \rightarrow 0, T \rightarrow 1)$

*Example.* Recursive applications:

- $n! = (n = 0 \rightarrow 1, T \rightarrow n \cdot (n - 1)!)$
- $\gcd(m, n) = (m > n \rightarrow \gcd(n, m), rem(n, m) = 0 \rightarrow m, T \rightarrow \gcd(rem(n, m), m))$
- $\sqrt{a, x, \epsilon} = (|x^2 - a| < \epsilon \rightarrow x, T \rightarrow \sqrt{a, \frac{1}{2}(x + \frac{a}{x}), \epsilon})$

*Example.* Propositional connectives defined by conditional expressions:

- $p \wedge q = (p \rightarrow q, T \rightarrow F)$
- $p \vee q = (p \rightarrow T, T \rightarrow q)$
- $\neg p = (p \rightarrow F, T \rightarrow T)$
- $p \supset q = (p \rightarrow q, T \rightarrow T)$

### Definition (form)

The expression  $y^2 + x$  is an example of a form.

### Definition (function)

A function substitutes arguments into a form to evaluate a result. It's necessary to know which arguments map to which variables of the form. Something like  $y^2 + x(3, 4)$  is not a function because it's not clear how  $(3, 4)$  should map to  $x$  and  $y$ . If we make explicit the positions of the variables in the ordered tuple of arguments, then the mapping is clear. So,  $\lambda((x, y), y^2 + x)$  is a function, where e.g.  $\lambda((x, y), y^2 + x)(3, 4)$  evaluates to  $4^2 + 3 = 19$ .

A function of  $n$  arguments is denoted

$$\lambda((x_1, \dots, x_n), \mathcal{E})$$

where  $\mathcal{E}$  is a form of  $n$  variables  $x_1, \dots, x_n$ .

### Definition (list of variables)

Given a function  $\lambda((x_1, \dots, x_n), \mathcal{E})$ , the ordered tuple  $(x_1, \dots, x_n)$  is called the *list of variables*.

**Definition (dummy variable, bound variable)**

Given a function  $\lambda((x_1, \dots, x_n), \mathcal{E})$ , the variables in the list of variables are called *dummy variables* or *bound variables*.

The symbol used for any bound variable may be changed without changing the value of the expression, provided that we make the same change for each occurrence of the variable and do not make two variables the same that previously were different.

*Example.* The functions  $\lambda((x, y), y^2 + x)$ ,  $\lambda((u, v), v^2 + u)$ , and  $\lambda((y, x), x^2 + y)$  are equivalent.

**Definition (free variable)**

Given a function  $\lambda((x_1, \dots, x_n), \mathcal{E})$ , a *free variable* is a variable which occurs in the expression  $\mathcal{E}$  but does not occur in the list of variables. Such an expression may be regarded as defining a function with parameters.

**Definition (collision of bound variables)**

A difficulty which arises in combining functions described by  $\lambda$ -expressions, or by any other notation involving variables, because different bound variables may be represented by the same symbol.

*Note.* The  $\lambda$ -notation is inadequate for naming functions defined recursively. For example,

$$\text{sqrt}(a, x, \epsilon) = (|x^2 - a| < \epsilon \rightarrow x, T \rightarrow \text{sqrt}(a, \frac{1}{2}(x + \frac{a}{x}), \epsilon))$$

converts into  $\lambda$ -notation as

$$\text{sqrt} = \lambda((a, x, \epsilon), (|x^2 - a| < \epsilon \rightarrow x, T \rightarrow \text{sqrt}(a, \frac{1}{2}(x + \frac{a}{x}), \epsilon)))$$

However, the right-hand side cannot serve as an expression for the function because there would be nothing to indicate that the reference to `sqrt` within the expression stood for the expression as a whole.

**Definition (label( $a, \mathcal{E}$ ))**

$\text{label}(a, \mathcal{E})$  denotes the expression  $\mathcal{E}$  provided that occurrences of  $a$  within  $\mathcal{E}$  are to be interpreted as referring to the expression as a whole.

*Example.* The `sqrt` function can be written as

$$\text{label}(\text{sqrt}, \lambda((a, x, \epsilon), (|x^2 - a| < \epsilon \rightarrow x, T \rightarrow \text{sqrt}(a, \frac{1}{2}(x + \frac{a}{x}), \epsilon))))$$

**A.1.3 Recursive Functions of Symbolic Expressions**

Objectives:

1. Define a class of symbolic expressions in terms of ordered pairs and lists.
2. Define five elementary functions and predicates, and build from them by composition, conditional expressions, and recursive definitions an extensive class of functions of which we shall give a number of examples.
3. Show how these functions themselves can be expressed as symbolic expressions.
4. Define a universal function `apply` that allows us to compute from the expression for a given function its value for given arguments.
5. Define some functions with functions as arguments and give some useful examples.

**Definition (S-expression)**

1. Atomic symbols are S-expressions.
2. If  $e_1$  and  $e_2$  are S-expressions, then so is  $(e_1 \cdot e_2)$ .

where *atomic symbols* refers to the symbols . ( and ) along with single digits, upper/lower case letters, and possibly other symbols. *S* stands for ‘symbolic’.

*Example.*

- $AB$  [Note:  $AB$  is an atomic symbol. If it were a composition of atomic symbols  $A$  and  $B$ , then it would be written as  $(A \cdot B)$ .]
- $(A \cdot B)$
- $((AB \cdot C) \cdot D)$

*Remark.* An arbitrary list

$$(m_1, m_2, \dots, m_n)$$

can be represented by the S-expression

$$(m_1 \cdot (m_2 \cdot (\dots (m_n \cdot NIL) \dots)))$$

where *NIL* is an atomic symbol used to terminate lists.

*Notation.*

- $(m)$  stands for  $(m \cdot NIL)$
- $(m_1, \dots, m_n)$  stands for  $(m_1 \cdot (\dots (m_n \cdot NIL) \dots))$
- $(m_1, \dots, m_n \cdot x)$  stands for  $(m_1 \cdot (\dots (m_n \cdot x) \dots))$
- $((AB, C), D)$  stands for  $((AB \cdot (C \cdot NIL)) \cdot (D \cdot NIL))$
- $((A, B), C, D \cdot E)$  stands for  $((A \cdot (B \cdot NIL)) \cdot (C \cdot (D \cdot E)))$

**Definition (function of S-expressions, M-expression)**

Functions, written in conventional functional notation, taking S-expressions as argument. The expression for a function of S-expressions is called an ***M-expression***.

*Example.*

- $\text{car}[x]$
- $\text{car}[\text{cons}[(A \cdot B); x]]$
- Note the use of square brackets instead of parentheses and the semicolon instead of the comma.

**Definition (atom[X])**

$\text{atom}[X]$  has the value of T or F according to whether X is an atomic symbol. For example:

- $\text{atom}[X] = T$
- $\text{atom}[(X \cdot A)] = F$

**Definition (eq[x;y])**

Given atomic symbols x,y,  $\text{eq}[x;y] = T$  iff x and y are equivalent atomic symbols. For example:

- $\text{eq}[X;X] = T$
- $\text{eq}[X;A] = F$
- $\text{eq}[X;(X \cdot A)]$  is undefined since  $(X \cdot A)$  is not an atomic symbol.

**Definition (car[X])**

$\text{car}[(e_1 \cdot e_2)] = e_1$ .  $\text{car}[X]$  is undefined if X is an atomic symbol. For example:

- $\text{car}[(X \cdot A)] = X$
- $\text{car}[((X \cdot A) \cdot Y)] = (X \cdot A)$

**Definition (cdr[X])**

$\text{cdr}[(e_1 \cdot e_2)] = e_2$ .  $\text{cdr}[X]$  is undefined if X is an atomic symbol. For example:

- $\text{cdr}[(X \cdot A)] = A$
- $\text{cdr}[((X \cdot A) \cdot Y)] = Y$

**Definition (cons[x;y])**

$\text{cons}[x;y] = (x \cdot y)$ . For example:

- $\text{cons}[X;A] = (X \cdot A)$

- $\text{cons}[(X \cdot A); Y] = ((X \cdot A) \cdot Y)$

*Remark.*

- $\text{car}[\text{cons}[x;y]] = x$
- $\text{cdr}[\text{cons}[x;y]] = y$
- $\text{cons}[\text{car}[x]; \text{cdr}[x]] = x$ , provided that  $x$  is not atomic
- $\text{cons}[\text{car}[(X \cdot A)]; \text{cdr}[(X \cdot A)]] = \text{cons}[X; A] = (X \cdot A)$

### Definition ( $\text{ff}[X]$ )

$\text{ff}[X]$  is equivalent to the first atomic symbol of the S-expression  $X$ . For example:

- $\text{ff}[((A \cdot B) \cdot C)] = A$
- $\text{ff}[x] = [\text{atom}[x] \rightarrow x; T \rightarrow \text{ff}[\text{car}[X]]]$

### Definition ( $\text{subst}[x;y;z]$ )

$\text{subst}[x;y;z]$  is equivalent to the S-expression resulting from substituting the S-expression  $x$  for all occurrences of the atomic symbol  $y$  in the S-expression  $z$ . For example:

- $\text{subst}[x;y;z] = [\text{atom}[z] \rightarrow [\text{eq}[z;y] \rightarrow x; T \rightarrow z]; T \rightarrow \text{cons}[\text{subst}[x;y;\text{car}[z]]; \text{subst}[x;y;\text{cdr}[z]]]]$
- $\text{subst}[(X \cdot A); B; ((A \cdot B) \cdot C)] = ((A \cdot (X \cdot A)) \cdot C)$

### Definition ( $\text{equal}[x;y]$ )

$\text{equal}[x;y] = T$  iff  $x$  and  $y$  are equivalent S-expressions. For example:

- $\text{equal}[x;y] = [\text{atom}[x] \wedge \text{atom}[y] \wedge \text{eq}[x;y]] \vee [\neg\text{atom}[x] \wedge \neg\text{atom}[y] \wedge \text{equal}[\text{car}[x]; \text{car}[y]] \wedge \text{equal}[\text{cdr}[x]; \text{cdr}[y]]]$

*Remark.*

- $\text{car}[(m_1, m_2, \dots, m_n)] = \text{car}[(m_1 \cdot (m_2 \cdot (\dots (m_n \cdot \text{NIL}) \dots)))] = m_1$
- $\text{cdr}[(m_1, m_2, \dots, m_n)] = \text{cdr}[(m_1 \cdot (m_2 \cdot (\dots (m_n \cdot \text{NIL}) \dots)))] = (m_2 \cdot (\dots (m_n \cdot \text{NIL}) \dots)) = (m_2, \dots, m_n)$
- $\text{cdr}[(m)] = \text{cdr}[(m, \text{NIL})] = \text{NIL}$
- $\text{cons}[m_1; (m_2, \dots, m_n)] = (m_1, m_2, \dots, m_n)$
- $\text{cons}[m; \text{NIL}] = (m, \text{NIL}) = (m)$

**Definition (null[x])**
$$\text{null}[x] = \text{atom}[x] \wedge \text{eq}[x; NIL]$$
**Definition (cadr[x], caddr[x])**

- $\text{cadr}[x] = \text{car}[\text{cdr}[x]]$  - car (a) and cdr (d) makes c(ad)r
- $\text{caddr}[x] = \text{car}[\text{cdr}[\text{cdr}[x]]]$  - car (a) and two cdr's (dd) makes c(add)r
- etc...
